

Calculating angles on a straight line

There are two right angles on a straight line. This means that the angles on a straight line must add up to 180° . Use this knowledge to work out the missing angles below.

$$\text{Angle 1} = 180^\circ - 80^\circ = 100^\circ$$

$$\text{Angle 2} = 180^\circ - 120^\circ =$$
