

**Fill in the missing words. You might have to listen to the video several times to get this one right!**

Over two thirds of the \_\_\_\_\_ is covered in water.

Water is \_\_\_\_\_ to support all \_\_\_\_\_ on the planet.

Water never leaves the Earth and its \_\_\_\_\_.

It simply moves around in what is called the water \_\_\_\_\_.

The water cycle is the continuous journey of water from oceans and lakes, to \_\_\_\_\_, to rain, to streams, to rivers and back into the ocean again.

When the sun shines, it causes water to \_\_\_\_\_ turning it into a gas - water vapour.

This process is called \_\_\_\_\_.

The water vapour rises and collects in the \_\_\_\_\_ as clouds.

When the water vapour cools down, it condenses, turning back into liquid and falls back to earth as \_\_\_\_\_: rain, snow, hail or sleet.

This water then moves across land as run-off, and ends up in \_\_\_\_\_.

It then flows back to the sea or lakes and the \_\_\_\_\_ starts again. Water moves continuously around this cycle.

The water we use today has been around for as long as the Earth.

So next time you take a drink of water, remember, it's the same water the

\_\_\_\_\_

drank!
